

BreakingPoint Custom Application Toolkit

Accelerate proprietary application traffic to harden cyber infrastructure

No two networks are alike, and many are hit with more than thirty applications at the same time. Although most of those are traditional and popular applications, the networks will also be handling traffic from proprietary or unique applications.

The frequent emergence of new applications and the presence of proprietary applications can expose hidden vulnerabilities within an organization's cyber infrastructure. Identifying those vulnerabilities requires measuring the direct impact of all types of applications and filling the "realism gap," which grows each day (see diagram below).

Service providers, enterprises, and government organizations need the flexibility to measure the resiliency of IT elements when faced with popular applications, new applications, and proprietary applications.

The BreakingPoint Cyber Tomography Machines[™] (CTMs) can emulate more than 150 applications out of the box. Through purchase of the BreakingPoint Custom Application Toolkit, users gain the ability to emulate any proprietary and custom applications needed for realistic measurement of the resiliency of a cyber infrastructure.

BreakingPoint Advantages

Leveraging the BreakingPoint Custom Application Toolkit and a BreakingPoint CTM, any organization can:

- Integrate custom application traffic onto the BreakingPoint CTM in a matter of hours
- Natively generate stateful application traffic from proprietary applications at up to 120 Gigabits per second
- Validate the effects of high session counts of proprietary traffic on cyber infrastructure devices and systems
- Enhance application traffic with BreakingPoint's library of more than 150 applications and more than 4,500 security strikes
